- (57)ABSTRACT

This invention is connected with the products and the process of coal-based fertilizer, the process of which starts with coal crushing, filtering, mixing with other substances such as salt and essential nutrients maturing and forming the fertilizer into granules or prills (granulation). The processes of crushing and filtering will make the coal change into a simple form so that it can more easily be used by plants, while the granulation process will make this coal fertilizer easier to use when the application of fertilizing has to be done.
